Company Overview

1. Organization and Services

Northstar Services is a fictional professional services company used for training and demonstrations. It provides technology consulting, application support, and process improvement services to medium and large organizations. Its offices are located in Bengaluru, Pune, and Hyderabad, and project teams may work with customers across India.

The company organizes its work into consulting, engineering, customer support, finance, people operations, and information technology teams. Each customer engagement has a named engagement lead who coordinates scope, delivery dates, staffing, and communication. The lead keeps a written record of decisions and raises changes that could affect cost, quality, or timing.

Northstar aims to give customers clear, dependable service. Teams agree on the expected outcome before starting work, explain assumptions, and provide progress updates on a regular schedule. When a request falls outside the agreed scope, the team documents the request and discusses options with the customer before beginning additional work.

This example document describes general operating practices for the fictional organization. It is not a statement of any real company policy, contract, or service commitment.

Company Overview

2. Teams and Project Delivery

At the start of an engagement, the project team prepares a short delivery plan. The plan identifies the business goal, work products, owners, dependencies, and important dates. Team members review the plan together so that responsibilities are understood and work is not duplicated.

Project leads hold a weekly status review. They compare completed work with the plan, discuss upcoming activities, and record risks or decisions that need attention. A risk should include a clear description, its possible effect, an owner, and the next action. High-impact risks are raised promptly with the customer contact and the appropriate Northstar manager.

Engineering work is reviewed by another qualified team member before it is released. Reviewers check that the change meets the stated requirement, that relevant documentation is updated, and that known issues are recorded. Customer deliverables are stored in the approved project workspace so the team can identify the latest version.

Teams hold a closeout review at the end of a project or major phase. The review captures what was delivered, open items, customer feedback, and lessons that may help future work. The engagement lead confirms who owns any follow-up action and when it is due.

Company Overview

3. Customer Support and Communication

Customers can contact the support desk through the service portal or the published support email address. Each request is recorded with the date, requester, affected service, description, and business impact. The support team assigns a priority using the impact and urgency information available at the time.

The person who owns a support request keeps the record current. Updates should state what has been checked, what remains to be done, and when the customer can expect another update. If the request must move to another team, the original owner explains the handoff and confirms that the receiving team has accepted it.

A service interruption that affects multiple users or a critical customer activity is escalated to the on-call lead. The lead coordinates technical response and customer communication. After service is restored, the team records the cause when known, the recovery steps, and any prevention work that should be considered.

Routine support is available Monday through Friday, 9 AM to 6 PM local business time, excluding published holidays. These hours are part of this fictional training example only. Actual support hours and response commitments must be confirmed in the relevant service agreement.
